

**ABSTRACT**

A carrier of replacement batteries for a portable electronic device or the like. The carrier includes a housing defining receptacles adapted to receive and seat the replacement batteries and a plate incorporating strips of adhesive or the like material which allow the carrier to be secured directly to the surface of the device for which the replacement batteries may be needed at the point-of-use. In one embodiment, rotatable panels with ears hold the batteries in place in the carrier and clips are adapted to hold the panels down against the plate when the carrier is not in use. In another embodiment, rotatable collars are adapted to surround and hold the batteries in the receptacles.
